Standard version hydrogen

Screw in, connect, start measuring

Analog
4–20 mA

The thermal conductivity is precisely determined with the help of a microthermal sensor. For hydrogen in methane applications, it can derive the percentage of both gases. Unlike the market standard, this robust, compact and inexpensive device requires neither readjustment nor reference gases.

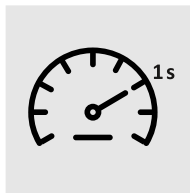

The two-wire connection allows easy integration into the control system without further knowledge of bus topology. The simple screw-in connection requires only minimal intervention in the pipe system and does not require an exhaust line.

The instrument is pressure compensated and therefore independent of the prevailing process pressure.
